

Roger Mobile Device Manager (RMDM) is an application for mobile devices with Android and iOS operating systems used for low-level configuration of selected Roger devices. Communication between the mobile device and the device being programmed takes place via the transmission in the Bluetooth standard. The application is used during device installation in order to adapt the

device to a specific usage scenario and also during its operation. In the latter case, the program enables the management of autonomous functions offered by a given type of device. The RMDM automatically adapts displayed screens to the device with which the application is currently working.

**Roger Mobile
Device Manager**

List of supported devices:

ADL-2

- electronic lock
- remote generation of PIN codes
- access by PIN, proximity card or Android/iOS mobile phone
- four AAA battery supply
